

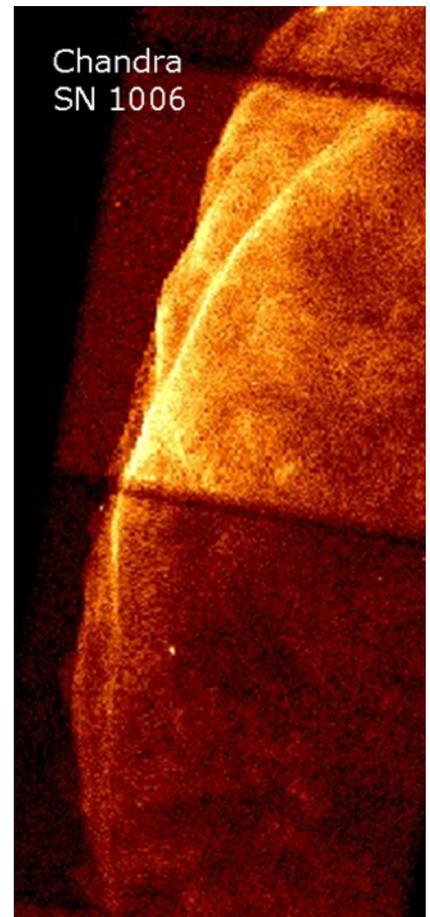

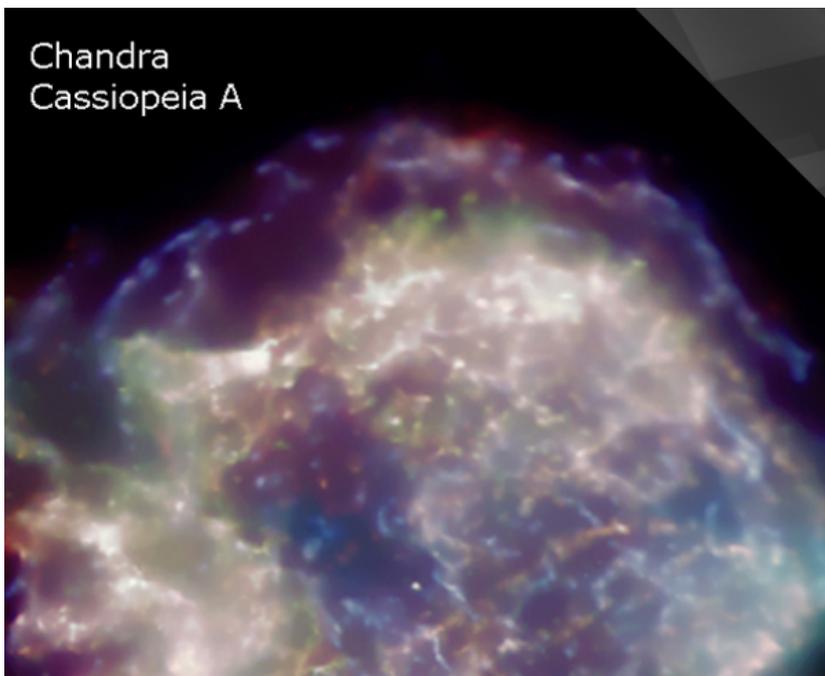

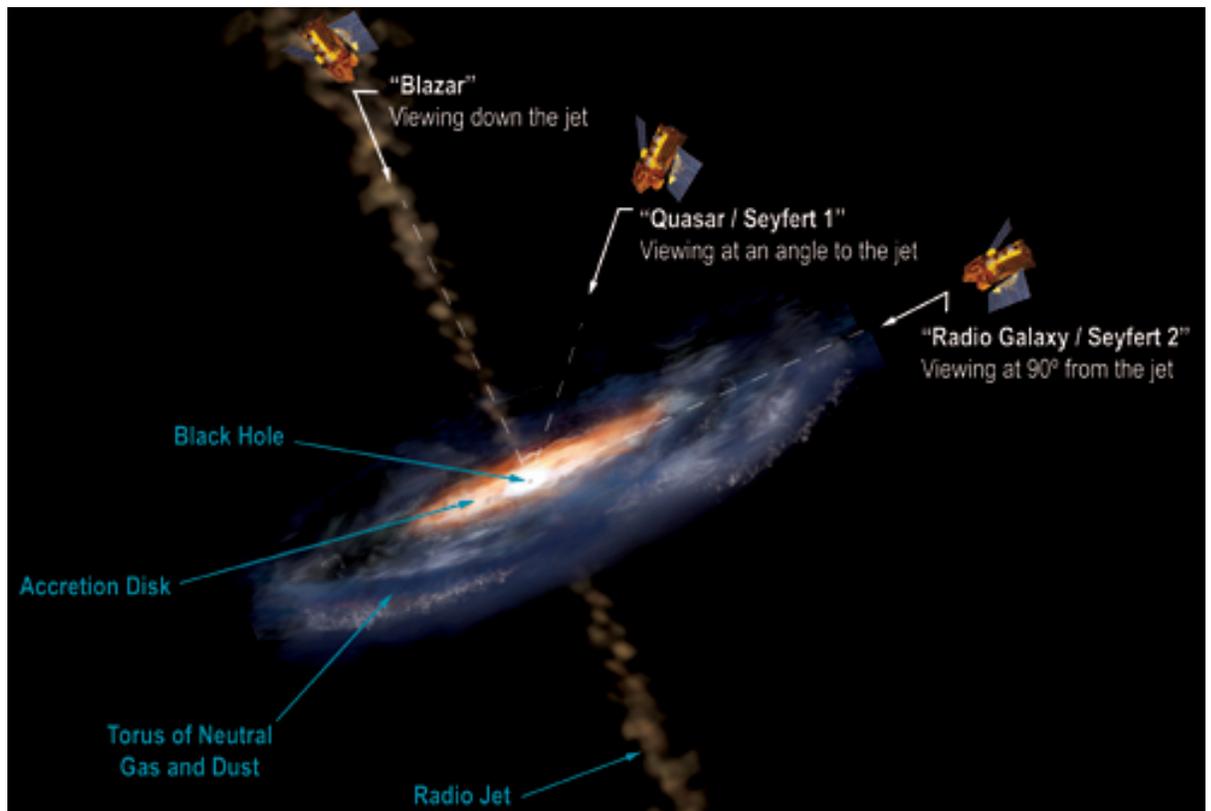

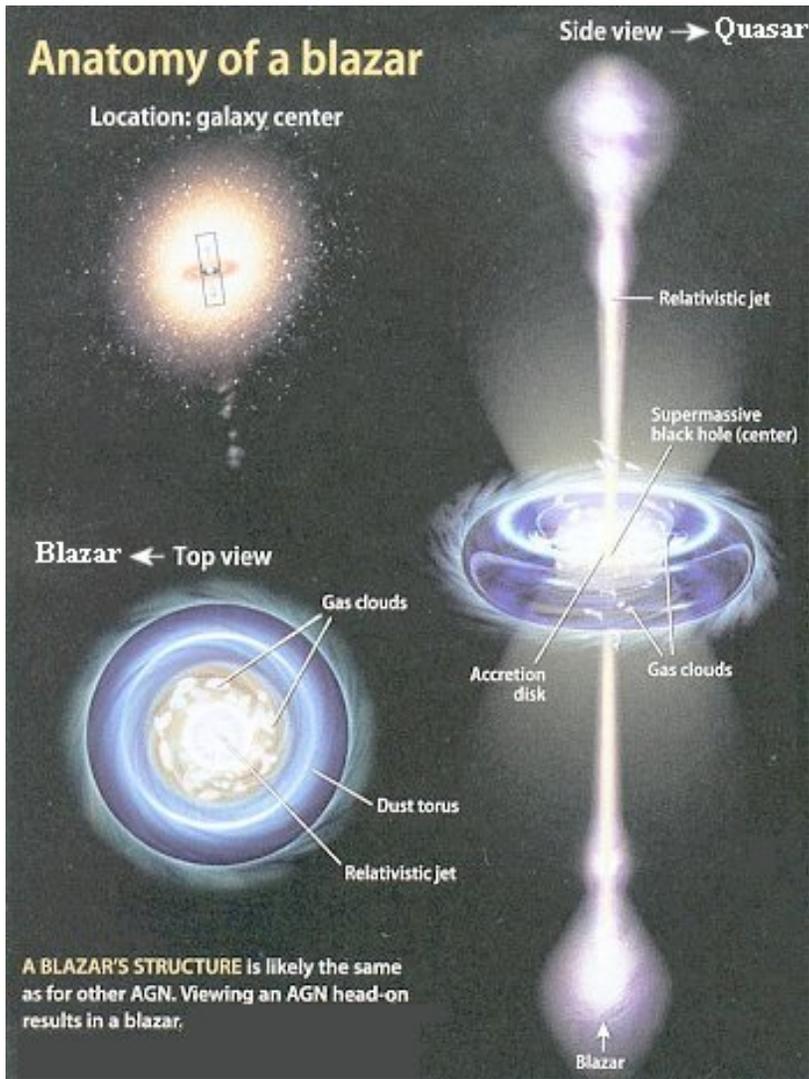

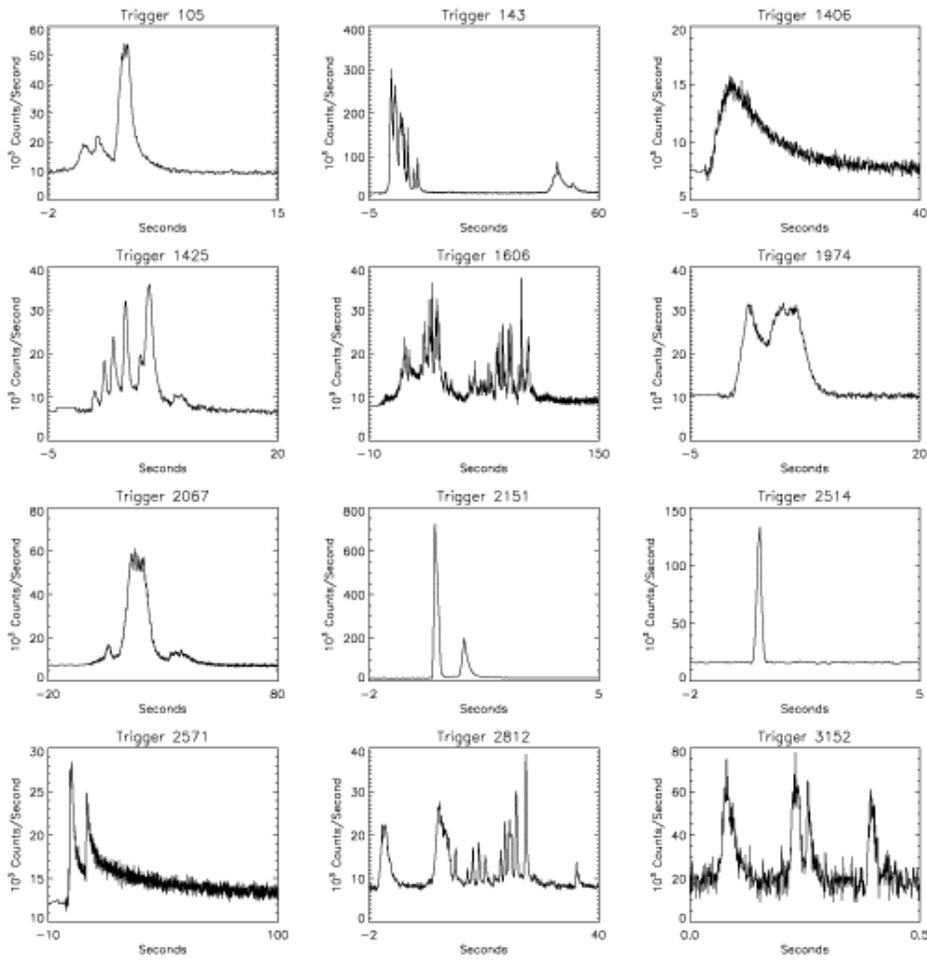

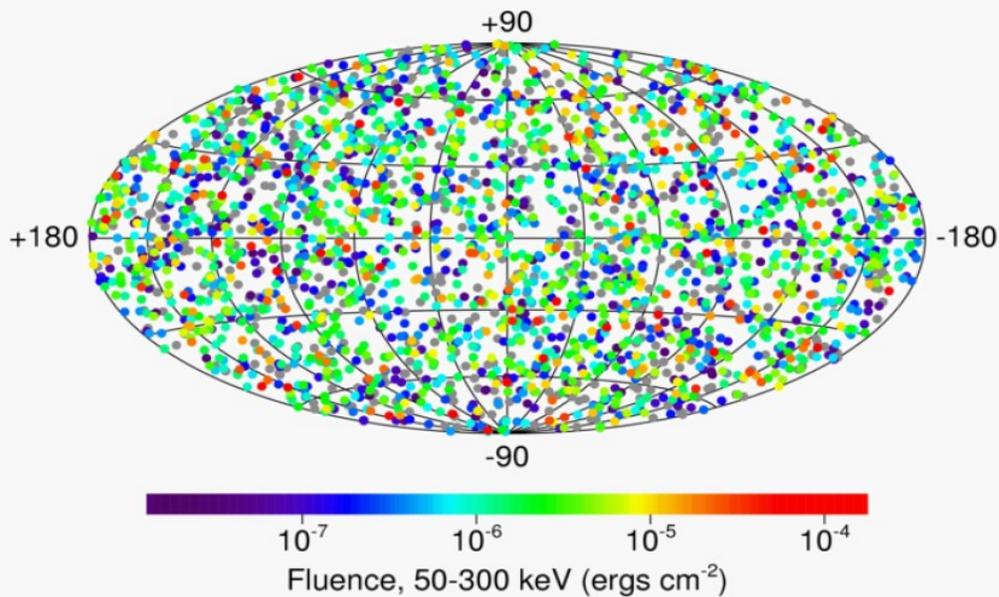

Fig. 10.1. Interaction length for γ -ray (solid) and electron (dashed line) interactions on the universal photon backgrounds. Only the major process of production of electron–positron pairs is plotted for gamma-rays. The electron interaction length is shown for inverse Compton effect.

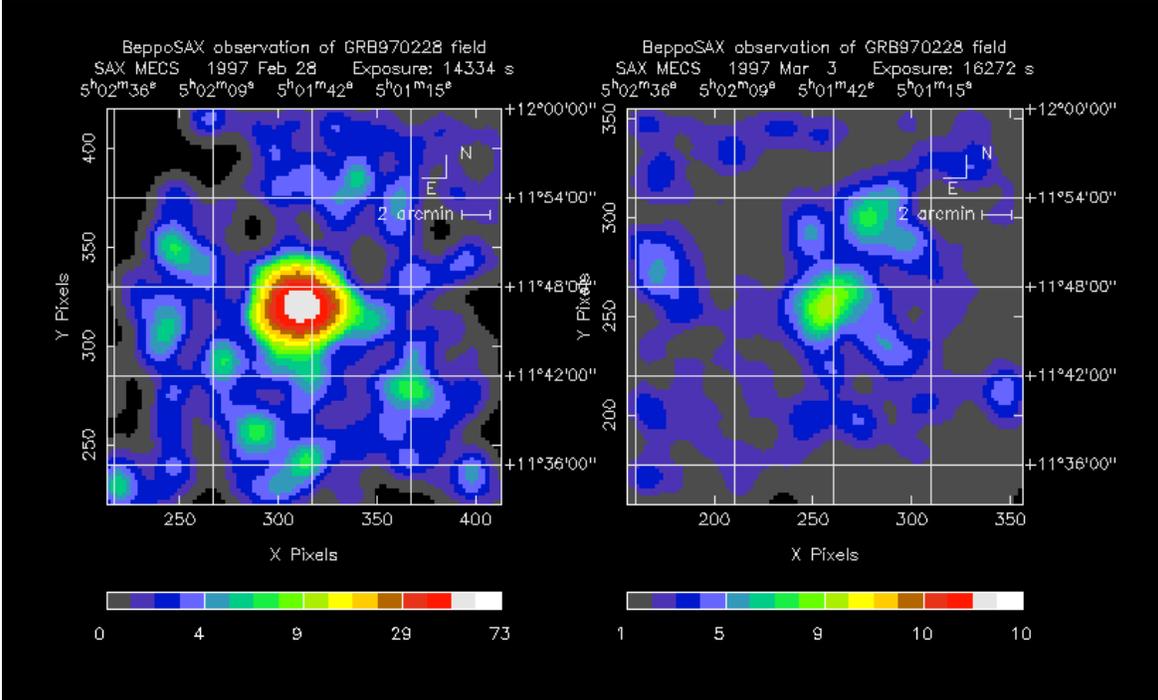

2704 BATSE Gamma-Ray Bursts

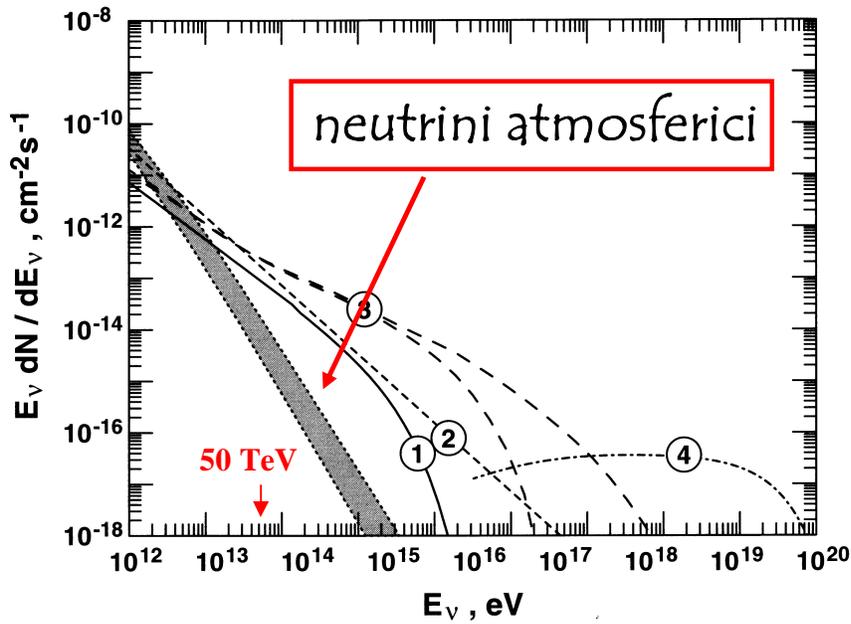

Fig. 10.12. Predictions of neutrino fluxes from different types of sources. (1) is the neutrino flux that would correspond to the gamma-rays of SNR IC443. (2) is the neutrino emission that would correspond to hadronic origin of the Mrk 501 gamma-ray outburst. (3) is the range of neutrino emission from the core of 3C273, and 4) is a prediction for the neutrino emission of 3C279. The shaded area shows the atmospheric neutrino flux within 1° – from high (horizontal) to vertical.

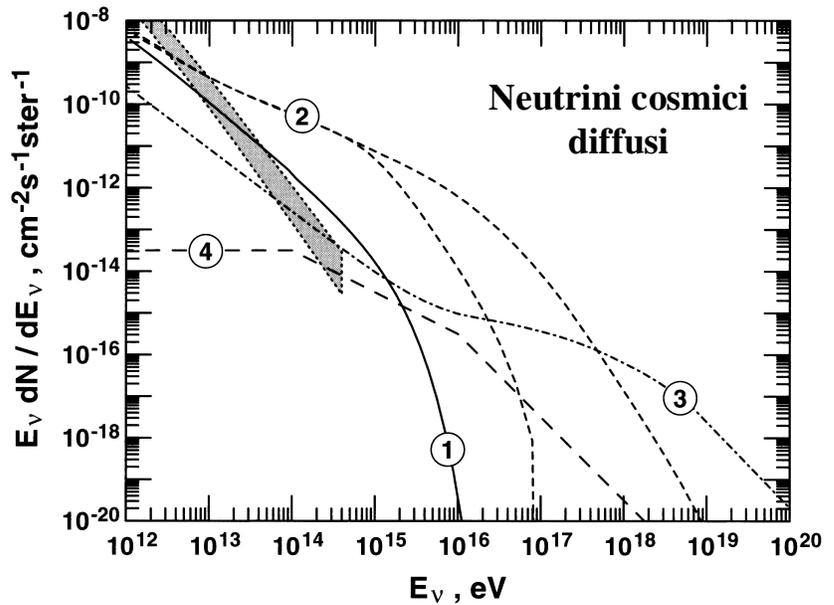

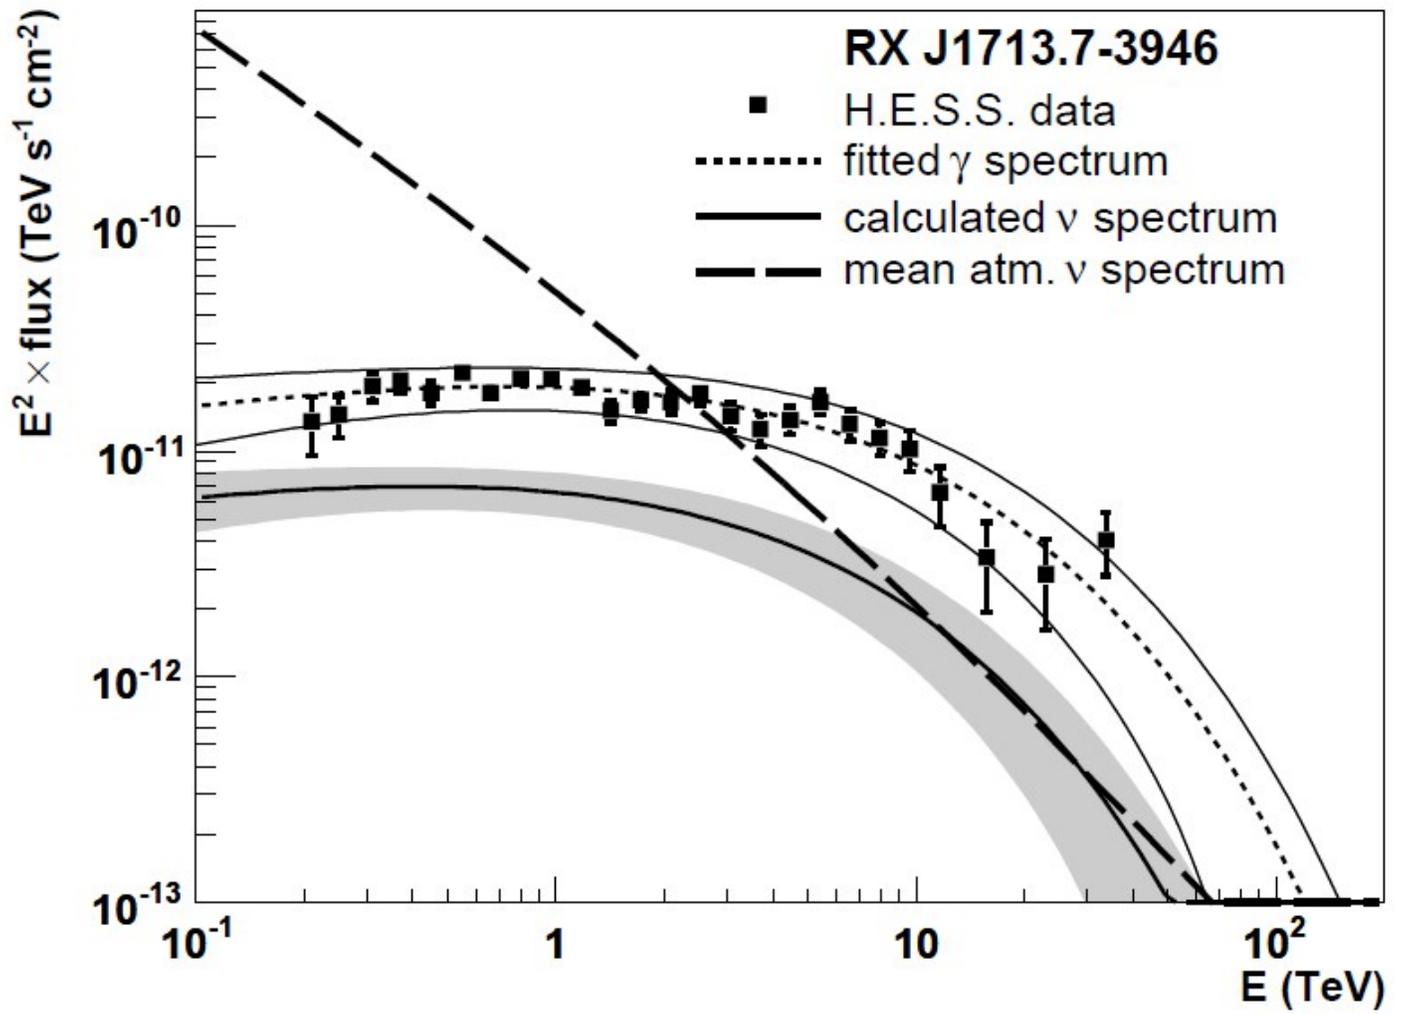

Fig. 10.13. Predictions for diffuse neutrino fluxes. The shaded area shows the horizontal (higher) and vertical fluxes of atmospheric neutrinos. Curve (1) is for the central region of the Galaxy, (2) corresponds to the curves (3) from Fig. 10.12, (3) is the prediction of Ref. [359] and (4) is the prediction of the GRB neutrinos of Ref. [358].

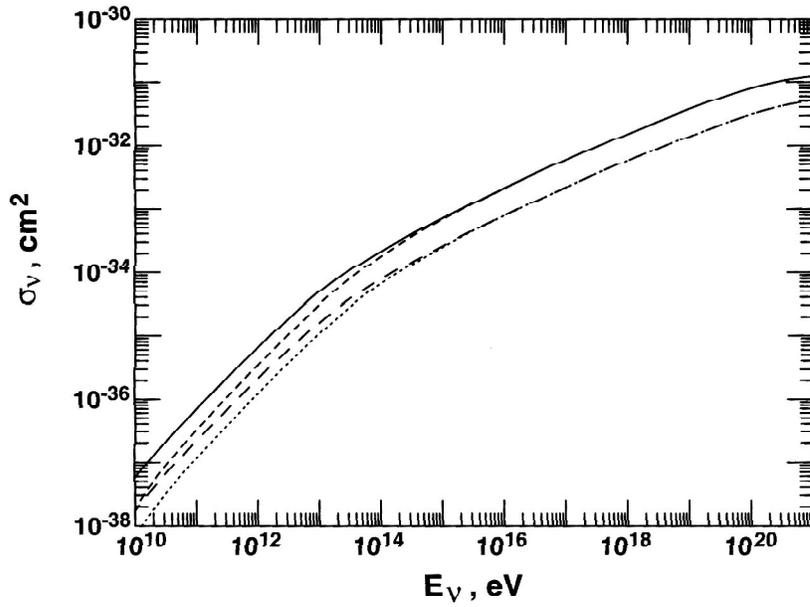

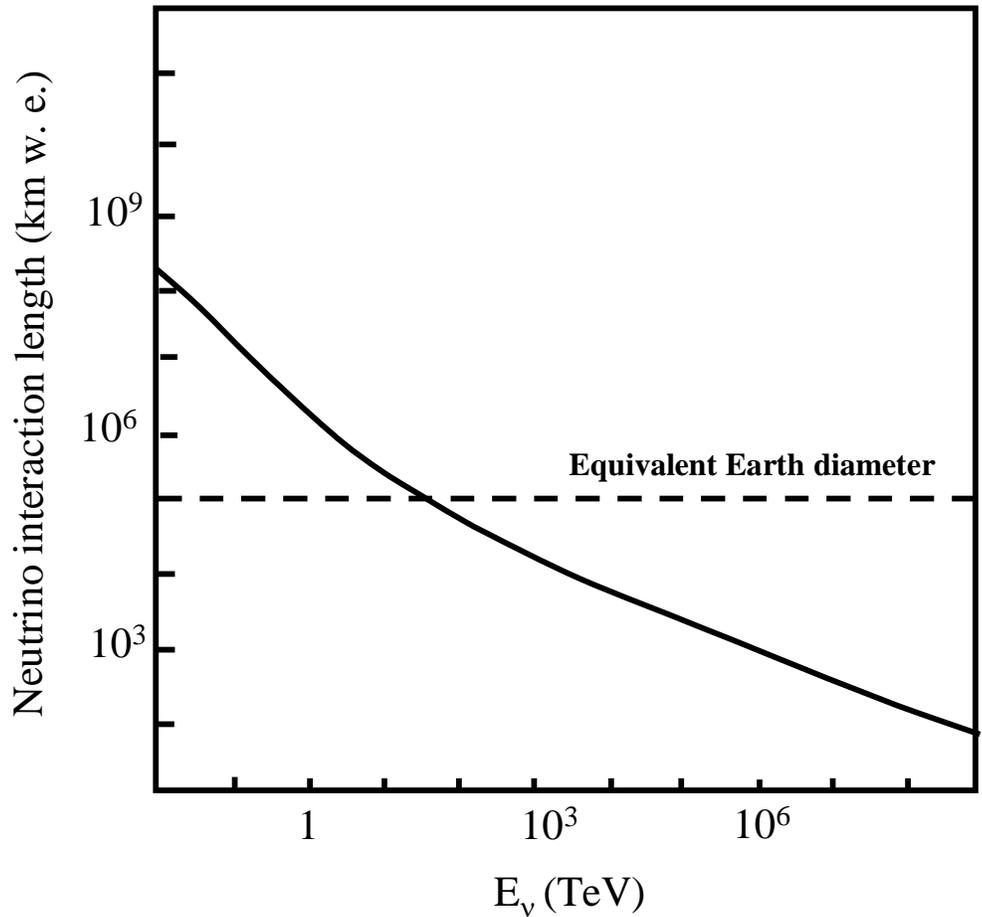

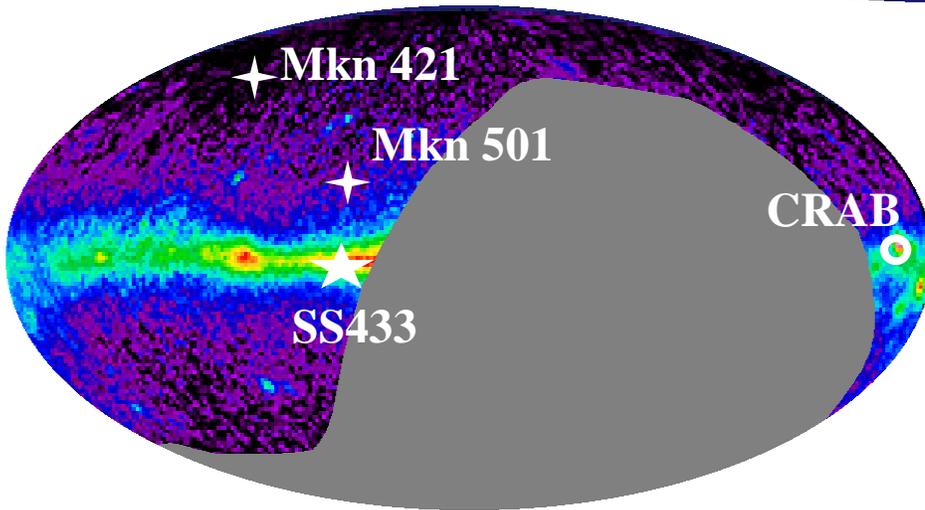

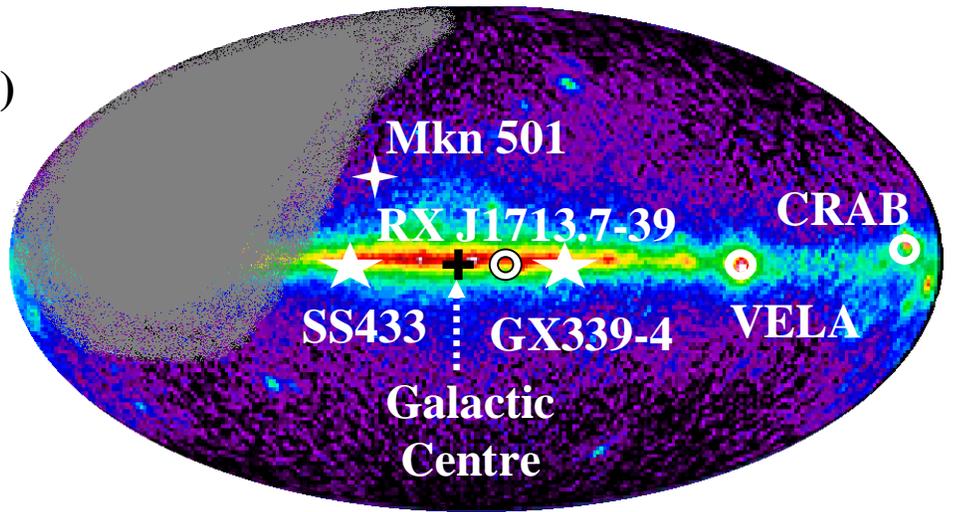

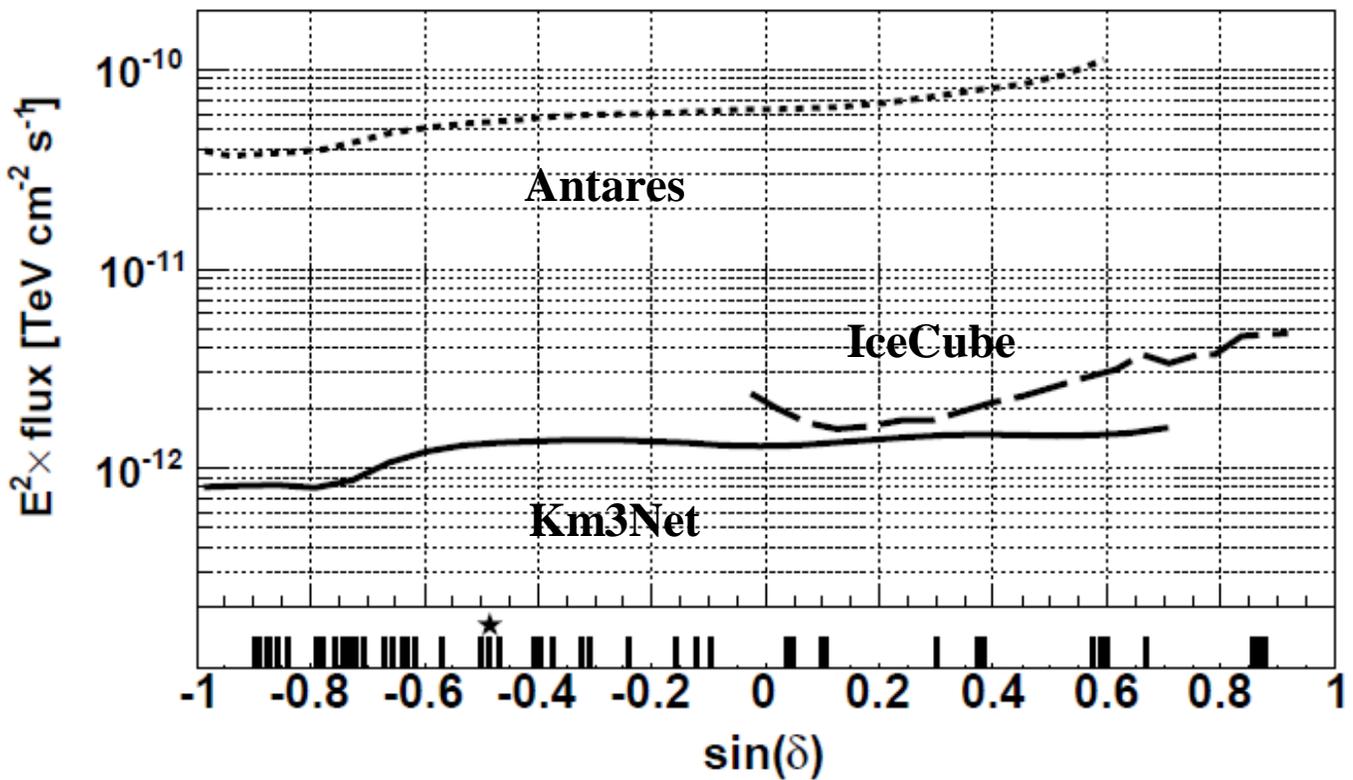

Fig. 10.2. Cross-sections for deep inelastic neutrino scattering. Neutrino CC cross-section is plotted with a solid line, the antineutrino with short dashes. The NC cross-section for neutrinos are plotted with long dashes, and for antineutrinos with a dotted line.

	T	C	B	E	W	N	S
Number of scintillator boxes	7	6	10	2	7	0	0

RUN 19574 EVENT 2198 at 10:33:47.90 on 5/24/2000

	T	C	B	E	W	N	S
Number of scintillator boxes	6	3	3	0	0	0	0

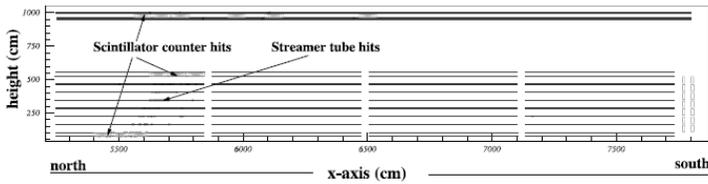

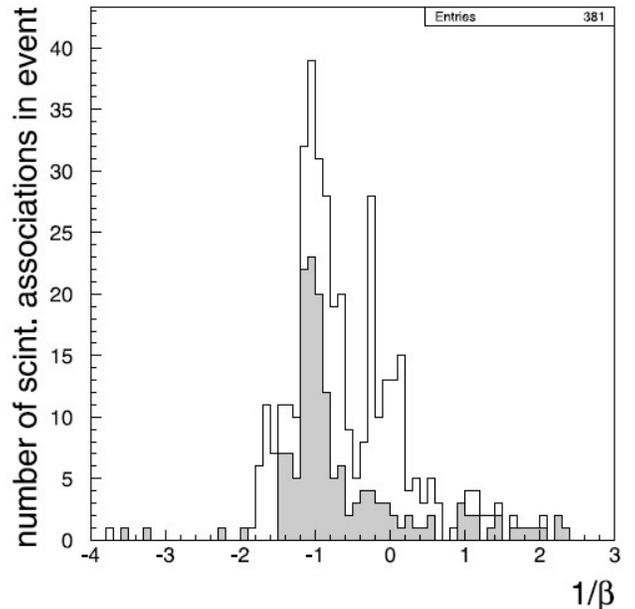

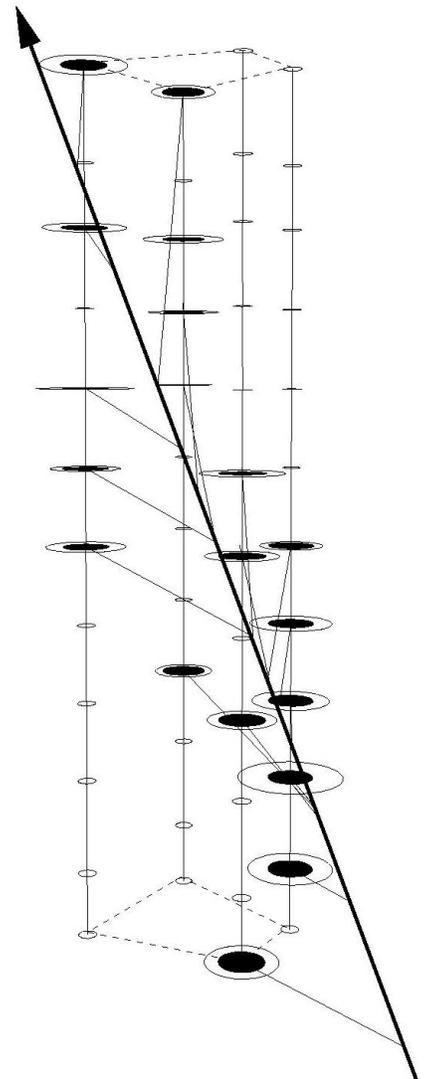

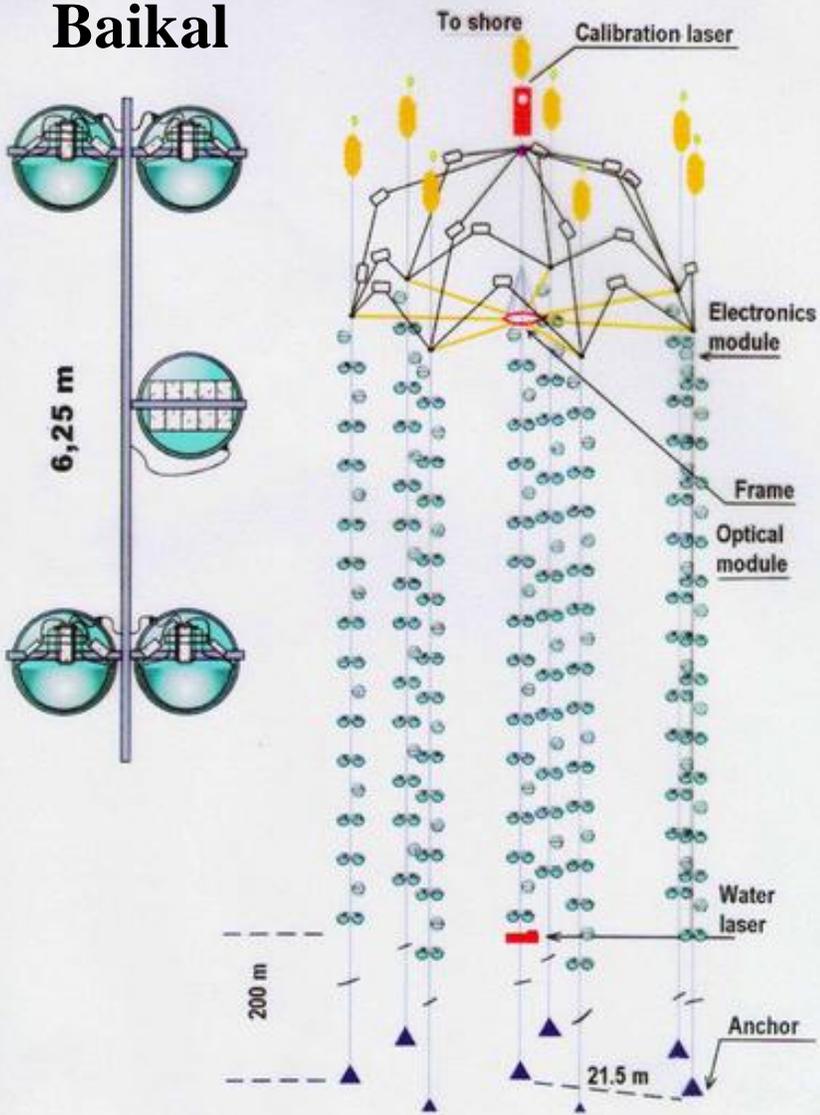

Fig. 8. Display of the two surviving events (longitudinal view) along the x-axis. The horizontal lines represent the 10 + 4 planes of horizontal streamer tube wires in the bottom and in the "Attico" parts of the detector. The wire hits are represented by black points. The gray boxes represent scintillator hits. Thirty-two scintillation counters overall fired in the first event which correspond to 381 scintillator tracks, whose $1/\beta$ values are shown in Fig. 5. Twelve counters fired in the second event. The location of fired scintillation counters is also given: T → Top, C → Central, B → Bottom, E → East, W → West, N → North, S → South, respectively.

Blazar 3C 454.3's Record Flare

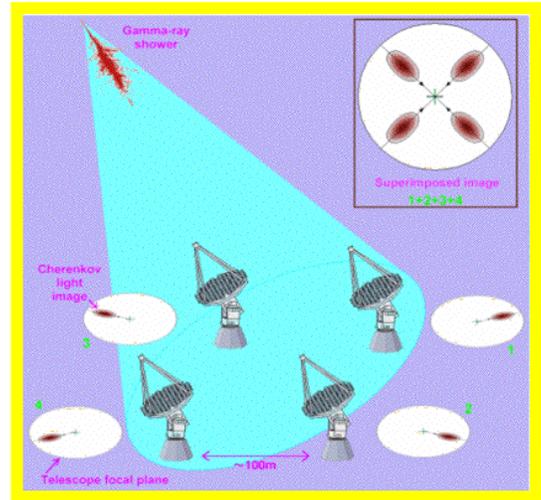

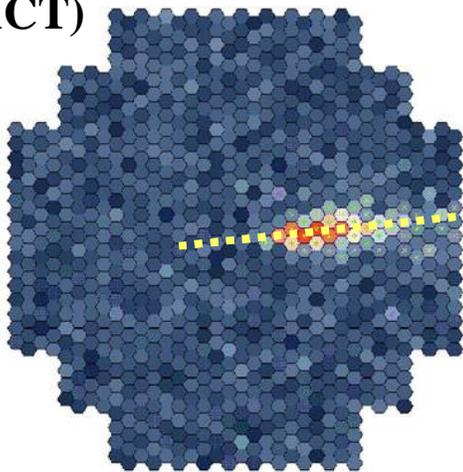

Unprecedented flares from the blazar 3C 454.3 in the constellation Pegasus now make it the brightest persistent gamma-ray source in the sky. That title usually goes to the Vela pulsar in our galaxy, which is millions of times closer (Credit: NASA/DOE/Fermi LAT Collaboration).

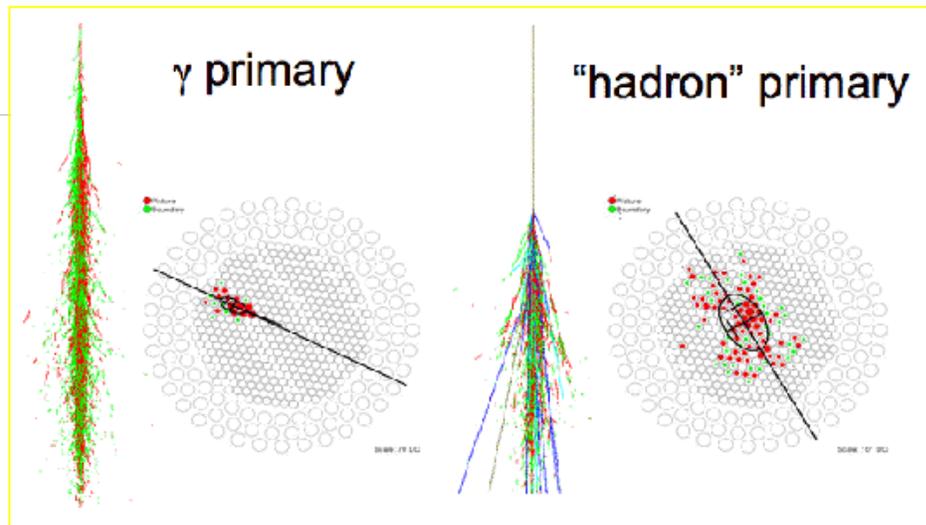

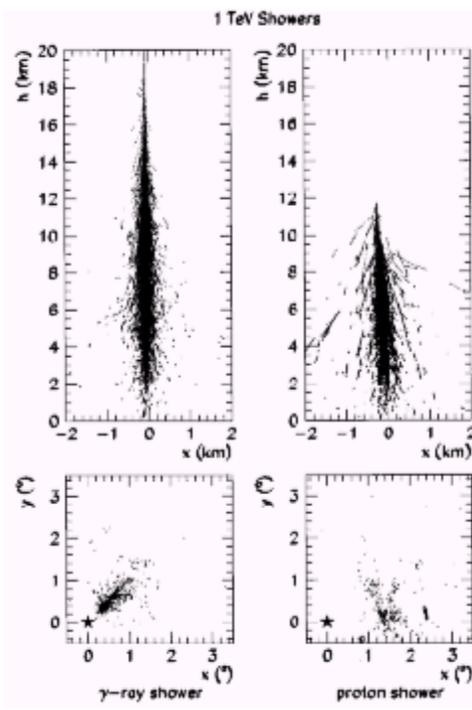

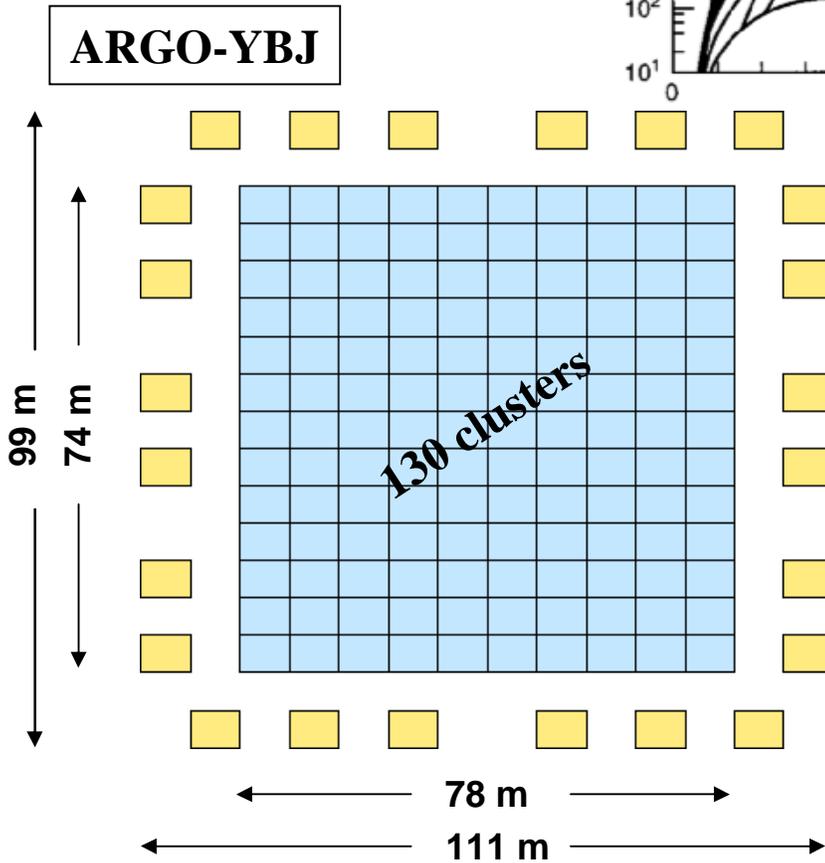

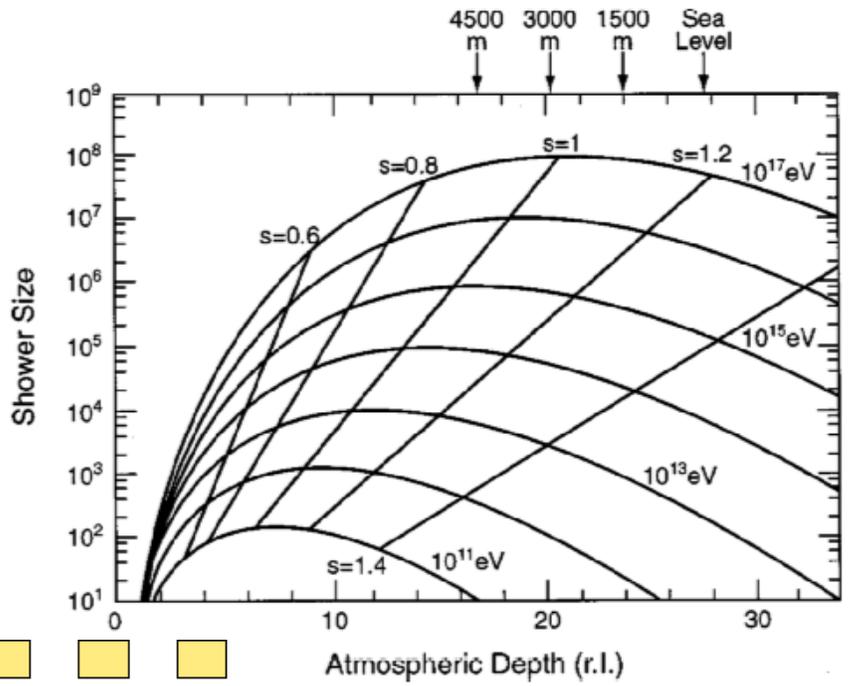

Left: the Fermi Telescope has made the first unambiguous detection of high-energy gamma-rays from the microquasar Cygnus X-3. Right: Fermi's Large Area Telescope (LAT) has shown that an intense star-forming region in the Large Magellanic Cloud is also a source of diffuse gamma rays. Brighter colours indicate larger numbers of detected gamma rays (Credit: Fermi collaboration).
